

# Overview of the Proposed Method

## Pretraining

Simulation scenarios  
SC1: exchangeable  
SC2/SC4: covariate shift  
SC3/SC5: outcome drift  
SC6: joint mismatch

Generate many  
current/external  
dataset pairs

Compute summaries  
 $s(D_c, D_e)$

Pretrain NPE  
 $q_\phi(\theta \mid s)$

pretrained once  
then reused

## Inference

New current/external  
dataset pair

Compute the same  
summaries

Apply pretrained  
NPE

Posterior for  
current-study  
target  $\theta$
